Currently, I am using this snippet of code: Process p = Runtime.getRuntime().exec("java -version"); StreamReader sr = new StreamReader(p.getInputStream()); String line = sr.readLine(); String[] processes = line.split(":", 2); System.out.println(processes[1]); It produces the following error: Exception in thread "main" java.lang.ArrayIndexOutOfBoundsException: 1 at MyProc.main(MyProc.java:47) A: There are several things to correct in your code: The Runtime.exec() call is not necessary. Just call your main method. The call to line.split() does not make any sense, because the first parameter to split is a delimiter, not a String, and the second parameter is the limit, not an integer. The variable line is already a String, so there's no need to convert it to a String[] A Process is an object that has an OutputStream and an InputStream. It is not some kind of file. It's like a pipe. To access the output stream, you need
