XamlViewer

/h Indicates whether the description should be displayed XamlViewer Notes: /n Indicates whether the notes section should be displayed XamlViewer Version Info: /v Indicates whether the version information should be displayed XamlViewer License Info: /l Indicates whether the license information should be displayed XamlViewer Settings: /s Indicates whether the settings section should be displayed XamlViewer Options: /o Indicates whether the options section should be displayed Additional options (refer to XamlViewer Help): /p, /s Indicates whether the project/solution name is displayed (default: yes) /r Indicates whether the root directory is displayed /v Indicates whether the version information should be displayed /e Indicates whether the file's encoding should be displayed /x Indicates whether the Xaml file's extension should be displayed /n Indicates whether the selected file's extension should be displayed /d Indicates whether the description should be displayed /l Indicates whether the license information should be displayed /x Indicates whether the selected file's extension should be displayed /f Indicates whether the file's last modification date should be displayed /p, /s Indicates whether the project/solution name is displayed (default: yes) /r Indicates whether the root directory is displayed /v Indicates whether the version information should be displayed /e Indicates whether the file's encoding should be displayed /x Indicates whether the selected file's extension should be displayed /n Indicates whether the selected file's extension should be displayed /d Indicates whether the description should be displayed /l Indicates whether the license information should be displayed /x Indicates whether the selected file's extension should be displayed Creating a XamlViewer App: Because it's XamlViewer, the application has an option that you can't miss: "Create application from selected xaml file". This is the most basic requirement for it to be useful. However, the application can handle Baml files too, since Xaml files can handle them. The code is same, the only difference is the association type. See the sample code below: XamlViewerSettings settings = new XamlViewerSettings()
